combinant human Telomerase Reverse Transcriptase and its are useful in the diagnosis, prognosis and treatment of cell on conditions especially cancer and ageing.

ig 74; 387pp; English.

sequence encodes human telomerase reverse transcriptase
h is a ribonucleoprotein. The present invention also
le following methods: (A) determining whether a test compound
or of hTRT, by detering the change in hTRT recombinant
olynucleotide, on administration of the compound; (B)
of recombinant telomerase by contacting a protein preparation
la telomerase RNA component; (C) detection of the hTRT RNA or
a sample by binding a relevant probe to the sample and
and correlating the presence of complex or amplification
la presence of hTRT in the sample; and (D) increasing the
on of a vertebrate cell by increasing hTRT expression; and (E)
an agent that causes an increase in cell vertebrate cell
on to create a medicament that inhibits ageing. A protein
of hTRT and the polynucleotide encoding hTRT can be used in
cure of medicaments for inhibiting the effect of ageing or
libitors of telomerase activity can be used to treat conditions
sociated with high telomerase activity. A protein preparation
also be used in the new methods

The present sequence encodes the catalytic subunit of a human to holoenzyme. Disruption of the telomerase gene alters telomera maintenance. The DNA is essential for telomerase activity, and i protein is physically associated with telomerase and a constituative telomerase complex. The products can be used for increas reducing the lifespan of cells such as cancer cells or transfor. They can also be used in the diagnosis and treatment of malispan addition, cells with a longer lifespan can be transplanted into grafted onto an individual (e.g. as skin grafts, as systems for of therapeutic proteins, such as hormones and enzymes), to whom
                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated human telomerase catalytic sub-unit gene - used to products for increasing or reducing the life span of cells such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CAGGCAGCGCTGCTGCTGCTGCGCACGTGGGAAAGCCCTGGCCCCGGCCACCCCC

WPI; 2002-315462/35. Novel hTERT-immortalized cell line (human telomerase reverse transcriptase) useful for human vaccine production and preparation antigen, such as a virus or virus-derived agent. Example 1; Fig 1; 64pp; English. Example 1; Fig 1; 64pp; English. The present sequence is that of hTERT cDNA in plasmid pGRN121. It the catalytic subunit of human telomerase. Claimed immortalised lines for use in vaccine production are adapted to express hTERT shitable cell lines comprise human diploid fibroblasts, e.g. MRC N134 cells, transfected with hTERT cDNA or infected by a retrovicarrying hTERT cDNA, and are capable of supporting antigen produmethod for preparing such cell lines using recombinant technique

lg a human telomerase reverse transcriptase (TRT).

nerase reverse transcriptase; TRT; T lymphocyte activation; 311; telomerase activity; cancer cell; proliferating cell; 1 destruction; telomerase; cancer; proliferation disease; ss.

The present sequence encodes a human telomerase reverse transcr (TR) polypeptide. The protein is used in the method of the inv The specification describes a method for activating a T lymphoc comprising contacting the T lymphocyte with a dendritic cell the expresses a TRT peptide in the context of a MHC class I or MHC molecule. The protein causes induction of an in vivo immunologic response to telomerase activity. Cancer cells are characterized expression of endogenous TRT gene and the presence of detectable telemerase activity. Therefore, by eliciting a specific immune to TRT or to TRT or to TRT gene and the presence of detectable to TRT or to TRT or immunological destruction. The method is proliferating cells for immunological destruction. The method is eliciting an in vivo immune response to telomerase by activatin I lymphocyte, and is useful for prevention and treatment of cance other proliferation diseases/conditions Eliciting an in vivo immune response for prevention and treatme GCAGCGCTGCTTGCTGCTGCGCACGTGGGAAGCCCTGGCCCCGGCCACCCCCGC GCGCGCTCCCCGCTGCCGTGCGCTCCCTGCTGCGCAGCCACTACCGCGA GCGCGCTCCCCGCTGCCGTGCGCTCCCTGCTGCTGCGCAGCCACTACCGCA GCCGCTGGCCACGTTCGTGCGGCGCCTGGGGCCCCCAGGGCTGGCGGCGGTGCA ccaacitectecacacciciteccacceccacacaacaacciceccerces GCTGCTGGACGGGGCCCCCCCGGAGGCCTTCACCACCACCAGGTGCGT 8 GCAGCGCTGCGTCCTGCTGCGCACGTGGGAAGCCCTGGCCCCCGGCCACCCCCGG accecrádece acertados de consenera de consen 241 AcGGCCGCCCCCGCCCCCTCCTTCGCCAGGTGTCCTGCTGCTGAAGGAGCT CCGAGTGCTGCAGAGGCTGTGCGAGCGCGCGCGAAGAACGTGCTGGCCTTCGG ö Sequence 4015 BP; 663 A; 1363 C; 1275 G; 714 T; 0 U; 0 Other; 2; Length 4015; /product= "telomerase reverse transcriptase" 0; Indels DB 99.3%; Score 4015; D 100.0%; Pred. f expression of mRNA encoding hTERT, the catalytic subunit of as an indicator of cancer, by amplifying RNA using primers Y to hTERT gene sequence and quantitating amplified products.

le 5-7; 29pp; English.

sequence is that of the hTERT gene encoding the catalytic the human telomerase, comprising 16 exons, which is useful in quantitating hTERT mRNA. The method is useful for detecting of beta-region (a 182 nucleotide region consisting of exons the hTERT-mRNA in a human sample for diagnosis and prognosis? He method provides an accurate measure of telomerase activity ly measuring mRNA that encodes an active hTERT protein

```
The invention relates to animal tissues with carbohydrate antig are compatible for transplantation into human patients. The man cell is inactivated homorygously for expression of alpha[1,3]ga transferase (alpha1,3T7) gene and comprises a transgene for alp fucosyltransferase (alpha1,2FT). It is useful for producing animit carbohydrate antigens that are compatible for transplantat human patients. The present sequence is human telomerase revers transcriptase (TERT) cDNA used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mammalian cells, useful for producing animal tissues with carbo antigens that are compatible for transplantation into human pat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 ścadciecniccnicniecnickienieskaniecnieskieko

e-stranded short interfering RNA having sense and antisense ds which are complementary to each other and to target nucleic telomerase RNA or mRNA encoding telomerase reverse

English. Fig 3A-B; 37pp; sequence is that of human telomerase reverse transcriptase. The invention relates to the discovery that double-stranded RNAs, such as short interfering RNAs (sirkN), which target RNA or TERT mRNA are capable of inhibiting telomerase nhibition of telomerase in cancer cells leads to telomera end-to-end chromosomal fusion, and apoptosis. Interference end-to-end chromosomal fusion, and apoptosis. Interference of activity can also be used for treatment of infertility, for on or sterilisation, for immunosuppression, for treatment of site and fungal infections, and in antiinflammatory therapies. Se is active in a limited number of cell types, e.g. tumour line cells, certain stem cells of the haematopoietic system, T, sun-damaged skin, and proliferative cervix, most normal ot affected by telomerase RNA interference therapy

Composition for treating wounds and enhancing epithelization of surface, comprises vector encoding telomerase reverse transcrit telomerized epithelial cells on a microparticle or a matrix.

Disclosure, Page 31-32; 68pp; English.

The present invention describes a pharmaceutical composition (Comprision an excipient or device, or comprises relowerised epithelial cell microparticle or a matrix suitable for topical administration administration administration to a wound site. (I) has vulnerary and antiulcer activities and can be used to promote epithelial cell migration cuseful for treating a wound and enhancing epitheliasation of a surface. The wound is especially skin wound including acute let as traumatic lesion, burn, or surgial inclain, chronic lesion chronic venous ulcer, diabetic ulcer or compression ulcer and the streamful companies is increased in epithelial cells at the site of treatment in thibroblasts or endothelial cells at the site of treatment in the preparation of a medicament for treatment condition of a medicament for treatment contrassed telomerase activity or many or an epithelial surface in a human or animal. An epithelial unface in a human or animal and a second or an epithelial endomerase activity or increased expression of a useful for preparation of a human or animal. An epithelial unface and a human or the treatment for treatment for an epithelial endomerase activity or increased expression of a useful for preparation of a human or animal. human or animal. (I) is also useful for treating wounds of othe epidermal surfaces including mucosal surfaces such as bronchus, nose, ossophagus, stomach, or intestine. The present sequence thuman TERT (hTERT), which is given in the exemplification of the invention. HTERT is located to chromosome 5

und maintain adipogenic capacity of the cell. This sequence the gene encoding the TERT protein. The cell strain can be earch to study all aspect of adipogenesis, especially in researching treatments for e.g. obesity. The cell can also be niify adipogenesis modulators for use as therapeutic agents mones, growth factors, cytokines, enzymes, cholesterol binding shotesterol removing proteins or their combinations. By, the therapeutic agent may be an adipocytokine, preferably

/alone lib="NIH BMAP FIO"
/alone lip The library was constructed according
Bonaldo, Leennon and Soares, Genome Research, 6:791-806,
1996. Denatured RNA was size fractionated on a 1% agarose
gel.First strand cDNA was size fraction and the Jugated
with EorN I adaptor, disperted with NotI and then cloned
with EorN I adaptor, disperted with NotI and then cloned
directionally into PXX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is CAGCACACAR. This library was created for the University
lows Brain Anatomy Project (RMAP): 'Gene Discovery in the
Developing Mouse Nervous System', supported by National
Institute of Mental Health (NIMH), Hemin Chin, Ph.D.,
